

## ABSTRACT

An elevator hall display device. A destination floor registration device includes destination buttons and assigned car display panels. An elevator group supervisory controller includes a hall destination call registration section that registers a hall destination call corresponding to an operation of a destination button, an assigned car decision section that decides an assigned car to respond to the hall destination call, an assigned car display mode controller that sets a display mode of the assigned car, and an assigned car display that makes the assigned car displayed on an assigned car display panel in the set display mode. The assigned car display mode controller sets the assigned car display to a first display mode until a predetermined time elapses from start of display of the assigned car on the assigned car display panel, and sets the display of the assigned car to a second display mode after the predetermined time elapses.
